Abstract: The paper intends to approach, from an anthropological point of view, near-death experiences (NDEs). The interdisciplinary character of anthropological sciences and their capacity to study human variability in its whole complexity makes it possible today to analyze the phenomenon of human experience (feeling) by NDE from a scientific, religious and philosophical point of view. The general character of the phenomenon identified by medicine on a large scale at present, as well as its individualized character demonstrates its cognitive importance. In this paper we attempt to analyze the phenomena of NDEs using the interface method which we developed in time. We started from the hypothesis that NDE is an interface between life and death, and, at the same time, between science and religion. Near-death experience is an Anthropological phenomenon, both individual and collective, that should be approached in its entire complexity and profoundness. It is highly relevant for practical and theoretical science and religion, as well as for understanding man’s and mankind’s origin, evolution and future.

Key words: Near-Death Experiences, interface, Informational Anthropology, archetypal communication.

Introduction

The object of study in our paper is the *analysis of the significance and importance of near death experience* (NDE) from the anthropological (A.) sciences point of view, mainly that of the Individual’s A. [Guja, 2000], Informational A. [Guja 2008 b], and Biocosmologic A. [Guja, 2008 - 2014] NDE refers to an individual experience in which the human being crosses the stages of biological death, in a state of deep unconsciousness (coma), which is not final, as he comes back to life spontaneously or by medical intervention. After a NDE it was found that the state of health was improved, which is difficult to explain scientifically. This situation is due to the fact that the person has memories of certain experiences that are special
